

## POWER MANAGEMENT

### Description

The LM2575/6 series switching regulators are monolithic integrated circuits designed for use in “buck” or “buck/boost” regulator applications requiring accurate output voltages over combined variations of line, load and temperature. This unique series greatly simplifies switching power supply design. The LM2575 has a maximum output current of 1A and the LM2576 is rated for 3A.

The LM2575/6 series miniconverters include a switching regulator and compensation network all within the same package. Just add a choke, catch diode and two capacitors to obtain an efficient DC-to-DC converter. The current limit and thermal shutdown features of the LM2575/6 series fully protect the device against overstress conditions.

The LM2575/6 series offers an alternative to popular 3 terminal linear regulators by providing higher efficiency with reduced heatsink size. In many applications a heat sink will not be required.

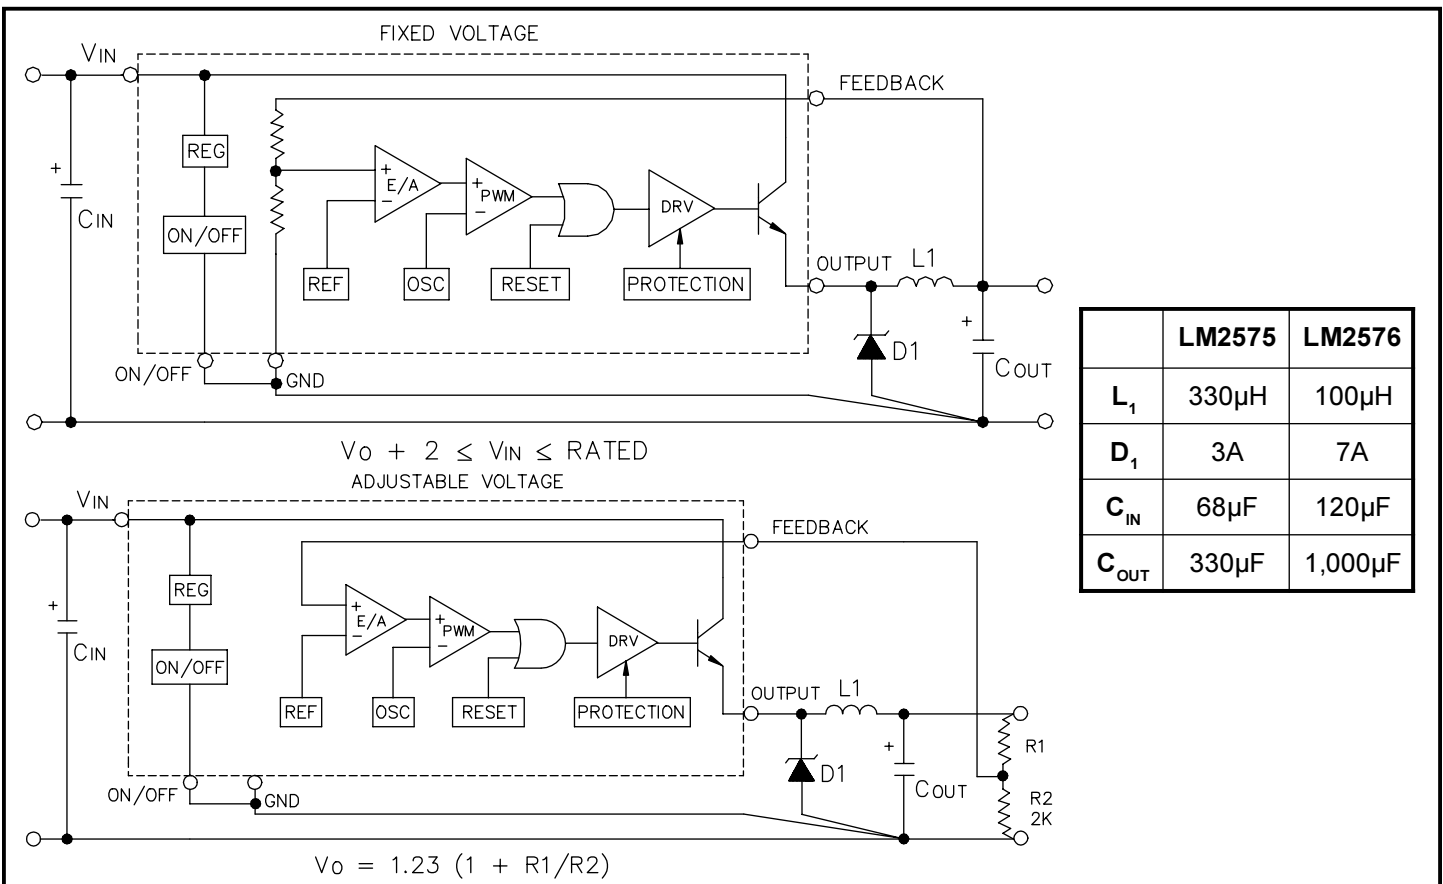

### Features

- ◆ Pin for pin replacement for National’s LM2575/6 series
- ◆ DC-to-DC buck or buck/boost converter requiring only 4 support components
- ◆ Fixed or adjustable voltages
- ◆ Preset output voltages of 3.3V, 5V and 12V
- ◆ Wide output voltage range, 1.23V to 35V
- ◆ 82% typical efficiency @ 5V out
- ◆ Wide input voltage range, 4V to 40V
- ◆ Inhibit/enable control pin
- ◆ Industrial temperature range
- ◆ TO-220 and TO-263 packages

### Applications

- ◆ Micro controller power supplies
- ◆ Medical equipment
- ◆ Industrial power supplies
- ◆ Instrumentation power supplies

### Typical Application Circuits

## POWER MANAGEMENT

### Absolute Maximum Ratings

Parameter	Symbol	Maximum	Units
Input Voltage	$V_{IN}$	45	V
On/Off Pin Input Voltage	$V_{ON/OFF}$	$-0.3 \leq V_{ON/OFF} \leq V_{IN}$	V
Output Voltage to Common (Steady State)		-1	V
Power Dissipation	$P_D$	Internally Limited	W
Thermal Resistance Junction to Ambient TO-220 TO-263	$\theta_{JA}$	55 60	°C/W
Thermal Resistance Junction to Case TO-220 TO-263	$\theta_{JC}$	2.0 2.0	°C/W
Operating Junction Temperature Range	$T_J$	-40 to +125	°C
Storage Temperature Range	$T_{STG}$	-65 to +150	°C
Lead Temperature (Soldering) 10 Sec.	$T_{LEAD}$	300	°C
ESD Rating (Human Body Model)	$V_{ESD}$	2	kV

### Electrical Characteristics

Unless otherwise specified:  $V_{IN} = 12V$  for 3.3V, 5V and ADJ options and 25V for 12V option;  $V_{OUT} = 5V$  for ADJ option;  $T_A = 25^\circ C$ ;  $V_{IN}$  rated = 40V;  $I_O = 0.5$  to 3A (LM2576), 0.2 to 1A (LM2575). Values in **bold** apply over full operating temperature range.

Parameter	Symbol	Test Conditions	Min	Typ	Max	Units
Output Voltage	$V_O$	$I_O = 0.5A$	3.23	3.30	3.37	V

On/Off Pin Input Current	$I_{IH}$	$V_{ON/OFF} = 5V$ (Off)		12	30	$\mu A$
	$I_{IL}$	$V_{ON/OFF} = 0V$ (On)		0	10	

#### Notes:

- (1) Output sourcing current, resistive load, no inductor or capacitor.
- (2) Feedback =  $V_O + 1.0V$ .
- (3) Feedback = 0V.

## POWER MANAGEMENT

### Pin Configurations

### Ordering Information

Device <sup>(1)</sup>	Package	Current
LM2575T-XX	TO-220-5 <sup>(2)(3)</sup>	1A
LM2575S-XX.TR	TO-263-5 <sup>(4)</sup>	
LM2576T-XX	TO-220-5 <sup>(2)(3)</sup>	3A
LM2576S-XX.TR	TO-263-5 <sup>(4)</sup>	

#### Notes:

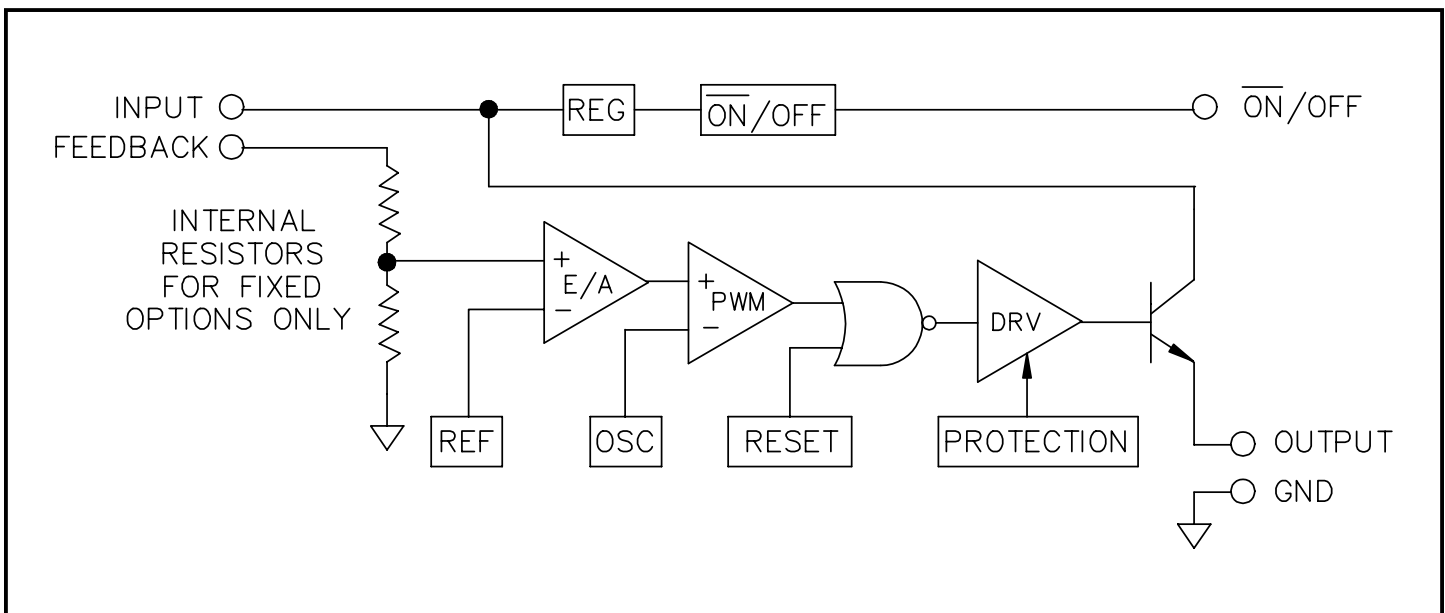

(1) -XX = Voltage Option. Available voltages are 3.3V (-3.3), 5V (-5.0), 12V (-12), and ADJ (-ADJ), which is adjustable between 1.23V and 35V.

(2) Lead bend options for TO-220-5 are: T-XX = Straight in-line; T-XX-V = Vertical Staggered; T-XX-H = Horizontal Staggered. Please refer to outline drawings at the end of this datasheet.

(3) Only available in tube packaging. A tube contains 50 devices.

(4) Only available in tape and reel packaging. A reel contains 800 devices.

### Applications Information - Buck Mode

The above component selections will be adequate for most applications for output currents from 250mA to 3A (LM2576) or 150mA to 1A (LM2575). Applications with  $V_{OUT}$  below 5V or above 24V may require component adjustment for maximum performance; please contact factory for application assistance.

**1. Device Selection.** Select an appropriate device from the "Ordering Information" guide based upon voltage option and package.

**2. Thermal Conditions.** Most applications will not require a heatsink for the TO-220 package. Approximate power dissipation is:

$$P = \frac{V_O I_O V_{SAT}}{V_{IN}} + 0.02 V_{IN} \frac{|V_O|}{V_{IN}}$$

**3. Catch Diode.** If the output must be capable of a sustained short, the  $I_F$  rating must be above 3A for the LM2575 and 7A for the LM2576. The use of an ultra fast diode with soft recovery characteristics or a Schottky will be adequate. The major impact on the selection of a

Schottky versus an ultra fast diode is efficiency. Schottkys will provide approximately 4% to 5% improvement for  $V_{OUTS}$  below 12V, whereas above 12V the difference will become less significant. Breakdown rating must be in excess of  $V_{IN}$  for margin.

**4. Input Capacitor.** The value shown will be adequate for most applications. Ripple voltage at the switching frequency is caused by the input capacitor supplying load current during the on time of the power switch. The use of a low ESR switching type capacitor will minimize ripple to an acceptable level.

**5. Layout.** Use short connections with a central point ground to prevent improper operation caused by stray inductance and ground loops.

**6. Output Capacitor.** Ripple voltage on  $V_{OUT}$  is directly related to the value of  $C_{OUT}$  and the internal resistance ESR of  $C_{OUT}$ . Output noise can be lowered by increasing  $C_{OUT}$  or by selecting a capacitor with a lower ESR. ESR must be a minimum of 0.03 $\Omega$  for the LM2576 or 0.07 $\Omega$  for the LM2575 to maintain stability, otherwise raise the value of  $C_{OUT}$ .

## POWER MANAGEMENT

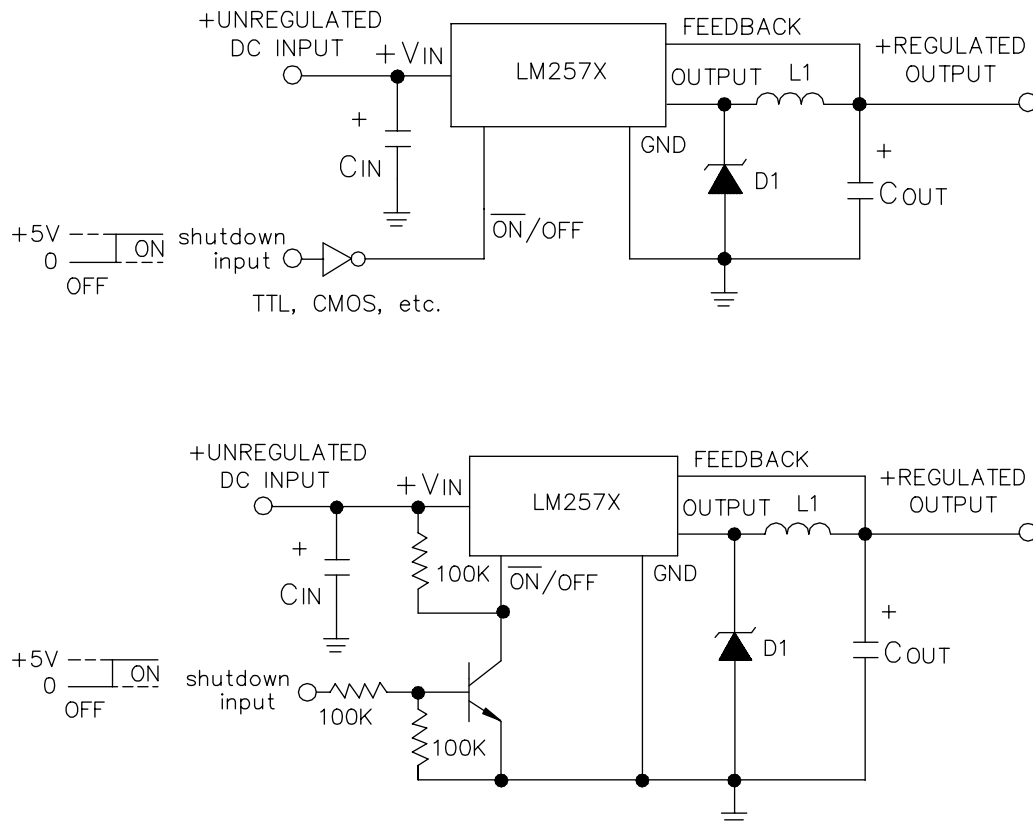

### Applications Information (Cont.)

**7. Switching Spikes.** Switching spikes will also occur due to distributive capacitance across turns of the inductor when combined with output capacitor series inductance (ESL). Reduction to a level at or below the switching ripple can be achieved by using a post filter as shown below.

#### Switching Spike Reduction

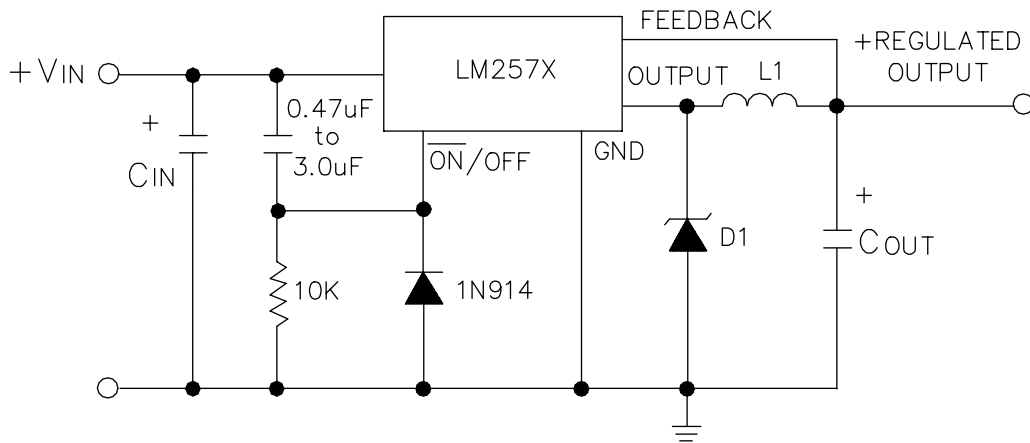

#### Typical Buck Shutdown

## POWER MANAGEMENT

### Applications Information (Cont.)

#### Turn-On Delay

Circuit allows for  $C_{IN}$  to be fully charged before start-up, provides  $C_{IN}$  to supply hi-peak current instead of input supply.

#### Under Voltage Lockout

Regulator will be off until a  $V_{IN}$  set point is reached.

$$V_{IN} (ON) \cong V_z + 3V_{BE Q1}$$

#### Turn-On Delay With Spike Filter

Spike filter reduces input noise, causing false triggering of delay.

## POWER MANAGEMENT

### Applications Information - Inverting Buck/Boost

	LM2575	LM2576
$C_{IN}$	47 $\mu$ F	100 $\mu$ F
$D1$	3A	7A
$L1$	100 $\mu$ H	68 $\mu$ H
$C_{OUT}$	2,700 $\mu$ F	6,800 $\mu$ F
$I_{OUT}$	250mA	500mA

	LM2575	LM2576
$C_{IN}$	47 $\mu$ F	100 $\mu$ F
$D1$	3A	7A
$L1$	100 $\mu$ H	68 $\mu$ H
$C_{OUT}$	470 $\mu$ F	2,700 $\mu$ F
$I_{OUT}$	100mA	750mA

Inverting buck/boost operation is a different topology of operation than buck. This difference reduces the output current capability of the device, in that the inductor must supply all of the load current during the time the power switch is off. Maximum output current is approximately:

$$I_{OUT} \approx \frac{3.5}{2 \left( 1 + \frac{|V_O|}{V_{IN}} \right)} \quad (\text{LM2576})$$

$$I_{OUT} \approx \frac{1.3}{2 \left( 1 + \frac{|V_O|}{V_{IN}} \right)} \quad (\text{LM2575})$$

Component stress requirements are very similar to the buck with a few exceptions:

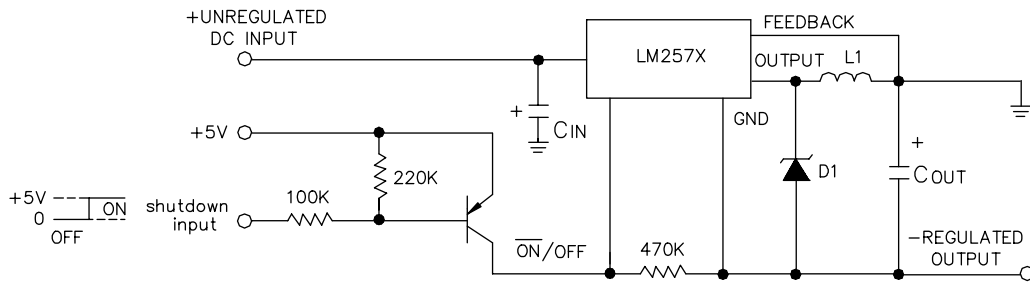

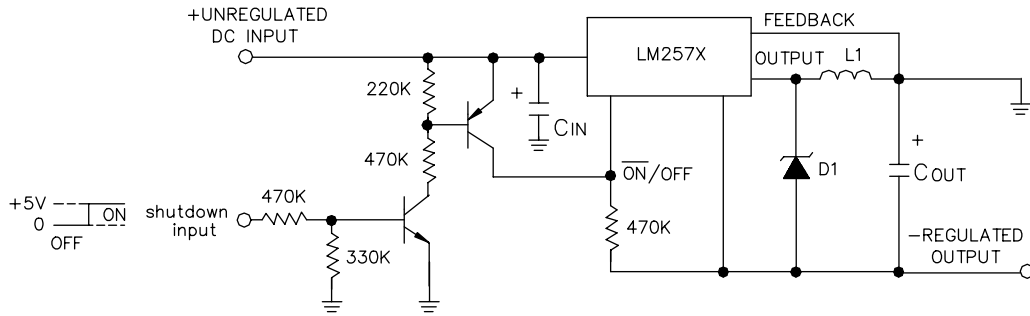

(1) catch diode breakdown  $V_{BR}$  must be greater than  $V_{IN} + |V_{OUT}|$

(2) input capacitor is larger due to the increased peak current during switch turn on. Power dissipation is approximately:

$$P_D \approx \left( \frac{|V_O|}{|V_O| + V_{IN}} \right) I_O \left( 1 + \frac{|V_O|}{V_{IN}} \right) V_{SAT} + 0.02 V_{IN} \frac{|V_O|}{V_{IN}}$$

Please contact factory for additional assistance when using the buck/boost topology.
